FONT INSTALLATION GUIDE

G-Type fonts come in OpenType OTF format, compatible with Mac & Windows PCs.

Installing OpenType OTF fonts on a Mac (OS X)

Your downloaded fonts will be contained inside a zipped archive. Before installing the fonts please ensure you expand the archive and unzip the fonts (double clicking on the .zip file should do the trick).

If using 3rd party font management software such as Suitcase please refer to the user manual. If you want to use Apple's own Font Book application simply drag and drop your new fonts into the software program to activate them (or double click the font files and click 'Install Font' in the preview window).

If you'd prefer to install the fonts straight into the Mac OS you have 2 choices:

- directly into the System Fonts folder seen by everyone (Mac HD > Library > Fonts)
- or
- restrict to your personal folder (Mac HD > Users > YOUR ACCOUNT > Library > Fonts)

Installing OpenType fonts in Windows 7 / Vista / XP / 2000

Unzip the fonts contained in the .zip archive and extract them to a temporary location on your desktop (or other preferred location).

Open the Fonts folder inside the Control Panel folder (look inside Appearance in Vista), then drag and drop the font files (ignore any other PDF licence or info files) into the folder. Or simply try a right mouse click on the font files and select 'Install'.

Alternatively navigate to your Control Panel Fonts folder from the Start menu and click 'Install New Font' under the File menu. You'll be prompted to locate the fonts (in this case sitting on your desktop), select them and click OK to add.
