

Green Bonds Global (CHF hedged)

Data as at end-July 2025

Investment focus

The fund invests primarily in a portfolio of global green bonds and high-quality money market instruments (with a credit rating from AAA to BBB-). Green bonds are bond instruments whose proceeds are used in whole or in part to finance or refinance new and/or existing projects that have a beneficial impact on the environment. The foreign currency risk is hedged against CHF.

¹ Total net asset value of the portfolio

Glossary

Benchmark (BM): An index that can be used by an investment fund as the basis of comparison for assessing the performance achieved.

Correlation: A statistic measurement which shows the linear relationship (or degree of parallel movement) between two series of figures, for example the performance of two equity investments.

Duration: Refers to the period of time that capital is tied into a monetary or bond investment or in other debt securities, and determines the sensitivity of the price to interest rate changes. Unlike residual maturity, the duration also takes into account interest payments and other inflows from invested capital.

Funds of Funds: These are investment funds which invest their fund assets in other target funds.

High water mark: The high water mark principle establishes a cap on or allows for a potential rise in performance fees. According to this principle, the investment fund manager only receives the relevant remuneration when the fund exceeds the highest level of return that it has ever achieved.

Information Ratio: The information ratio expresses the ratio of additional returns generated to the extra risk involved. The value generated can be used to evaluate active management.

Modified Duration: Modified duration is a measure of bond price sensitivity to changes in interest rates. Specifically, it measures the change in the value of a bond in response to a 1% (100 bps) change in interest rates.

Residual Maturity: Time remaining until a bond must be repaid.

Sharpe Ratio: The Sharpe ratio (risk-adjusted performance) is generated by calculating the difference between the average annualised return and the risk-free return. The resulting figure is divided by the annualised standard deviation of the returns. The higher the Sharpe ratio, the better the fund performance in relation to the risk potential of its portfolio.

Total Expense Ratio (TER): The TER is a measure of the total annual expenses incurred by a fund and is expressed as a percentage of its net asset value (NAV).

Tracking Error: The tracking error measures the divergence between the return of a fund in relation to its benchmark.

Volatility: A risk indicator demonstrating the fluctuation range (for example of the price or return of a security or fund unit) over a defined period; volatility is most often calculated using standard deviation. The higher the volatility, the greater the fluctuation range.

Yield to Maturity (YTM): The yield to maturity is the average yield generated by an investment each year if it is held until expiry.

Yield to Worst (YTW): The lowest potential rate of return an investor could receive on investment in a callable bond, assuming the bond does not go into default.
